

# Full Control Over Shared Computers And Accounts

SessionAudit transforms actions performed on shared computers with anonymous accounts into authenticated activities.

SessionAudit reports the users who have performed session activities on shared computers with shared user accounts within your organization. This allows you to track anonymous sessions on shared computers while ensuring full compliance with regulations.

Anonymous usage with shared accounts can create significant security risks; therefore, security and monitoring requirements are critically important.

# Secure Shared User Accounts With SessionAudit!

SessionAudit enhances system security by monitoring login activities through shared accounts.

The software restricts system usage when logging in with a shared user account and requires users to enter their own account credentials. Communication is ensured through secure HTTPS and LDAPS channels, ensuring the system remains continuously protected.
